The Collatz conjecture is a conjecture in mathematics that concerns a sequence defined as follows: start with any positive integer n . Then each term is obtained from the previous term as follows: if the previous term is even, the next term is one half the previous term. If the previous term is odd, the next term is 3 times the previous term plus 1.

Special case of Bernoulli random variables. Hoeffding's inequality can be applied to the important special case of identically distributed Bernoulli random variables, and this is how the inequality is often used in combinatorics and computer science. We consider a coin that shows heads with probability p and tails with probability $1 - p$. We toss the coin n times.
