The crucial operation in linear algebra is to take linear combinations of column vectors. This is exactly the result of a matrix-vector multiplication.  $Ax$  is a combination of the columns of  $A$ . When we take all combinations  $Ax$  of the column vectors, we get the column space.

1.1 Introduction. This book aims to bridge the gap between the mainly computation-oriented lower division undergraduate classes and the abstract mathematics encountered in more advanced mathematics courses. The goal of this book is threefold: 1. You will learn Linear Algebra, which is one of the most widely used mathematical theories around.

A zero vector is a vector with all elements equal to zero. Sometimes the zero vector of size  $n$  is written as  $0_n$ , where the subscript denotes the size. But usually a zero vector is denoted just  $0$ , the same symbol used to denote the number  $0$ . In this case you have to figure out the size of the zero vector from the context.

Linear algebra moves steadily to  $n$  vectors in  $m$ - dimensional space. We still want combinations of the columns (in the column space). We still get  $m$  equations to produce  $b$  (one for each row). Those equations

may or may not have a solution.
